OmniDev Engine: one-time setup

Close the old OPEN-COMPANION.cmd window. Download OmniDev Engine Windows ZIP, right-click and choose Extract All. Open the extracted folder and double-click INSTALL-ENGINE.cmd. Node.js 22 or newer must already be installed. Return to OmniDev and reconnect your account brain.

Automatic startup and updates

The engine runs in the background and starts when you sign in to Windows. Signed updates arrive through OmniDev when the account engine connects. They activate after active jobs finish and one idle minute. The previous release is restored automatically if the new release fails readiness.

Account protection

Account tokens and job memory stay on your computer. Each update must pass the pinned signing-key verification. The first installation requires your action. Do not disable Windows security protections if installation is blocked; report the exact message.

Stop or uninstall

Run UNINSTALL-ENGINE.cmd to disable startup and stop this engine. Account sign-in and job memory are preserved. SIGN-OUT.cmd is a separate account sign-out action.

What has been verified

Signature, tamper and replay rejection, file staging, and real supervisor rollback passed in the build environment. Windows installation, reboot, and downloaded-script behavior still require a real Windows test. With OmniDev closed, no fresh release is delivered; a staged update can still activate. Hosted execution workers are separate.

Your OmniDev domain

omnidev.mgrreign.com now has active routing and HTTPS. The engine allows this exact origin and the existing OmniDev Sites origin.
